

4-channel BTL driver for CD players

BA6392FP

The BA6392FP is a 4-channel BTL driver for CD player motors and actuators. It has an internal primary filter, and can be directly connected (without attached components) to the servo PWM output of all drivers other than the spindle driver. The BA6392FP is pin compatible with the BA6297AFP.

●Applications

CD players, CD-ROM drives

●Features

- 1) HSOP 28-pin package allows for miniaturization of applications.
- 2) PWM input is filtered by the internal primary filter, eliminating the need for attached resistors and capacitors, thereby helping reduce the number of components. Resistor and capacitor time constants can also be changed with attached components.
- 3) Internal thermal shutdown circuit.
- 4) Internal mute circuit.

●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	V _{CC}	18	V
Power dissipation	P _d	1.7*1	W
Operating temperature	T _{opr}	-30~+85	°C
Storage temperature	T _{stg}	-55~+150	°C

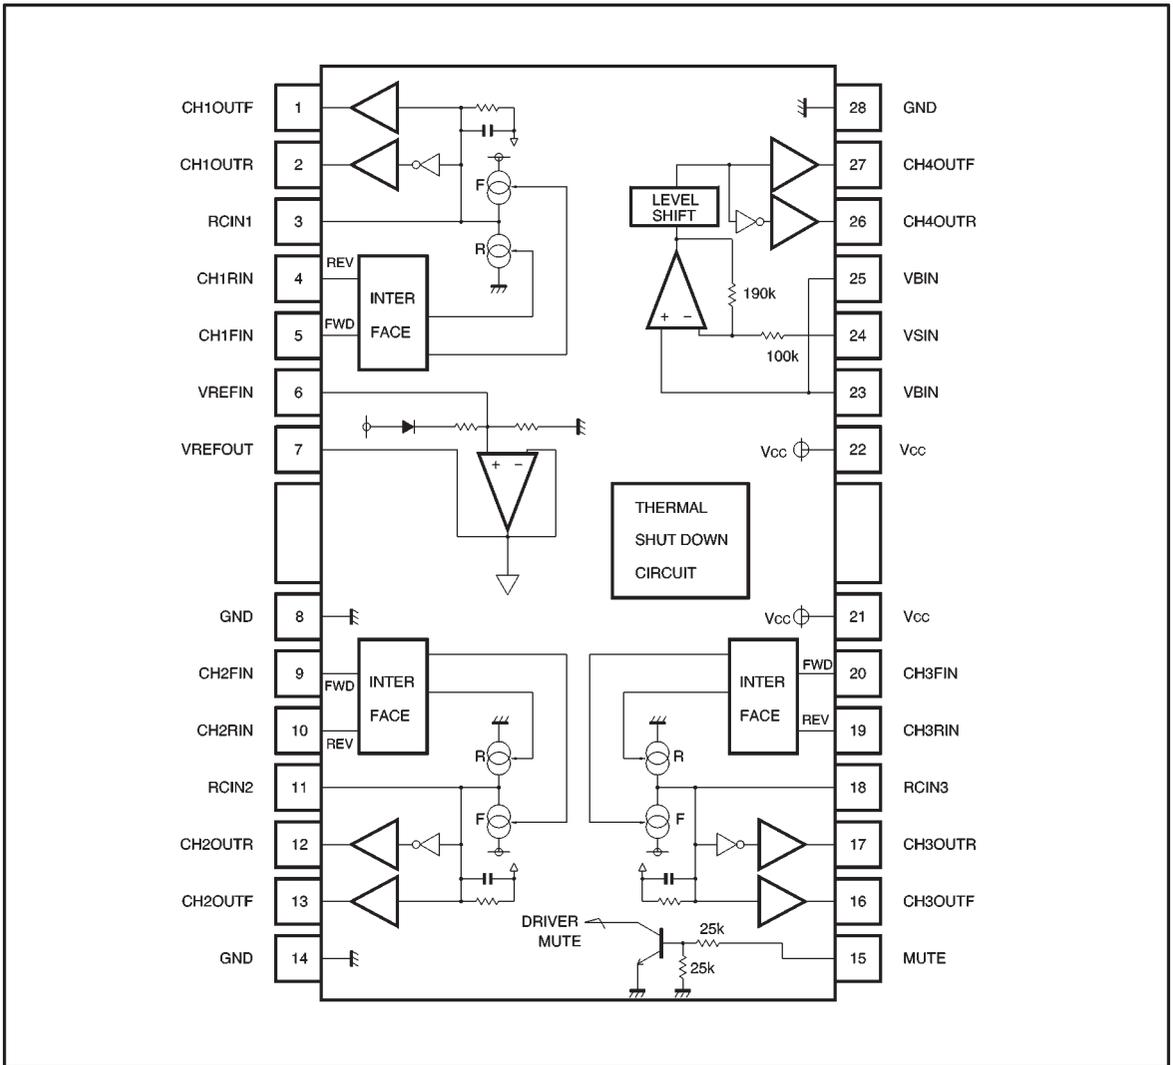

*1 Reduced by 13.6 mW for each increase in Ta of 1°C over 25°C.
When mounted on a 50 × 50 × 1.0 mm phenol paper PCB.

●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	V _{CC}	6~16*2	V

*2 Set the power supply voltage according to power dissipation.

● Circuit operation

(1) Fig. 3 shows the inputs from the digital servo IC for CH1-CH3 drivers (all drivers except the spindle). SW1 is on when the forward input signal (HIGH level, over 2.4V) is present. SW2 is on when the reverse input signal is present (Fig. 2)

The constant current (I_1) at this time enters the RC and generates an integral waveform based on the duty of the input waveform. The BTL is output from BUF1 and BUF2 (Fig. 4).

Fig. 2

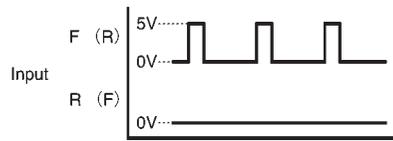

Fig. 3

To maintain the HIGH level with forward (or reverse) input, the DC voltage generated at point A is :

$$I_1 \times R \approx 2.5V \text{ (reverse : } -2.5V)$$

This is the voltage generated relative V_{REF} . The setting is such that a voltage differential of 5V is generated between output pins. The time constant is :

$$R \times C = 2.4\mu\text{sec}$$

This can be increased by inserting a capacitor between point A (pins 3, 11 and 18) and V_{REF} . The constant current (I_{const}) given in the electrical characteristics refers to I_1 and I_2 in Fig. 2.

(2) CH4 driver (spindle driver)

Pins 23 and 25 are shorted inside the IC. Bias amplitudes are the primary type of inputs assumed. The level shift circuit converts the pre-stage amplifier output (centered on the bias level and impressed on pins 23 and 25) to positive and negative amplitudes centered on V_{REF} . The level shift circuit's output is BTL-output from the buffer amplifier.

Because of the high input impedance, the IC is designed to accommodate a filter comprising attached resistors and capacitors.

● Operation notes

- (1) The BA6392FP has an internal thermal shutdown circuit. Output current is muted when the chip temperature exceeds 180°C (typically).
- (2) The output current can also be muted by lowering the mute pin (pin 15) voltage below 0.5V.
- (3) All four driver output channels are muted during thermal shutdown, muting and a drop in bias pin voltage. No other components are muted.
